01

SYSTEM OVERVIEW

What changes in the *current process.*

The system connects the tools your team already uses. It removes manual preparation while managers keep control of each decision.

RESEARCH REVIEWED

- [Company website]
- [Portfolio / markets]
- [Current tools or hiring signals]

PERSONAL NOTE FOR [CLIENT COMPANY]

[A specific observation about their maintenance operation]

From the public information I reviewed, your team appears to manage **[verified operating detail]** through **[known channels or PMS]**. The clearest fit is **[observed coordination problem]**. This system would connect the current intake path to **[Client PMS]**, so **[specific role]** receives a complete decision instead of rebuilding the context by hand.

Use only verified facts. Keep the final note to 55-80 words.

Today Current step		After integration What changes
EXISTING **Resident channels** Portal, email, SMS, phone	STAYS →	EXISTING **Resident channels** The same channels remain
MANUAL ~~**Read and sort**~~ Staff checks each message	REPLACED →	ADDED **Intake connector** Captures the message and identity
MANUAL ~~**Build the context**~~ Search PMS, policy, and vendors	REPLACED →	ADDED **Workflow + AI + rules + database** Links the unit, checks the issue, and prepares choices
EXISTING **Manager decision** Approve, hold, or assign	STAYS →	EXISTING **Manager decision** Receives one prepared decision
EXISTING **PMS + vendor channel** Work order and dispatch	STAYS →	EXISTING **PMS + vendor channel** Confirmed work is written and sent

- **Stays**
  Existing tools and human approval
- **Replaced**
  Manual reading, copying, and lookup
- **Added**
  Connectors, workflow, AI, rules, database

02

ONE REQUEST, FROM MESSAGE TO CONFIRMED ACTION

How the parts *work together.*

The same request moves down the page. Each step shows the actor, the software, and what is passed forward.

RESIDENT REPORT

"Water is spreading under the kitchen sink. The tap is off, but water is still coming out. My dog is inside. You may enter."

01	EXISTING **Resident channel** [SMS Provider], portal, email, or voicemail receives the report.	PASSES FORWARD **Message + sender ID**
	Webhook, API, or secure mailbox ↓	
02	ADDED **Coordination workflow** **AI model** — Reads the issue **Fixed rules** — Raise water priority **Database** — Links unit and history	PASSES FORWARD **Summary + reason + eligible plumbers**
	Manager alert with PMS link ↓	
03	EXISTING **Manager decision** The manager reviews the reason and selects the approved plumber.	HUMAN CHECKPOINT **Approved action**
	Nothing is sent to a vendor before this approval	
	Single-use approval action ↓	
04	ADDED **Send once and record the result** The workflow prevents a duplicate send and contacts [Vendor Channel].	PASSES FORWARD **Confirmed delivery result**
	Only confirmed state is used ↓	
05	EXISTING **[Client PMS] + resident channel** The PMS receives the work state. The resident receives a factual update.	VISIBLE RESULT **One tracked request**

WHAT CHANGES

For the operations team

- **01** Urgent issues reach the right manager sooner.
- **02** Requests arrive with key details prepared.
- **03** One request leads to one tracked vendor action.
- **04** Residents receive only confirmed updates.

If a step fails The request stays open, the failed step is recorded, and the case is sent to a person when needed.

03

A PRACTICAL CONNECTION MAP

How it fits into the *running business.*

The new service sits between the tools you already use and writes back only through approved connections.

EXISTING **Request sources**

- **[Resident Portal]** — Form, files, login
- **[Maintenance Email]** — Message and attachments
- **[SMS / Phone System]** — Text or voicemail event

Webhooks, APIs, secure mailbox, or provider events ↓

ADDED **Maintenance automation service**

Runs in [Client Cloud] or an approved managed cloud

- **Connectors** — Receive and send events
- **Workflow engine** — Moves each request
- **AI model** — Reads and prepares wording
- **Fixed rules** — Apply safety and approval policy
- **Operations database** — Stores state and duplicate keys
- **Queue and retries** — Holds failed actions

Client controls: credentials, data access, policy, approval limits, and who may act.

Approved reads, writes, alerts, sends, and event feeds ↓

EXISTING **Business systems**

- **[Client PMS]** — Residents, units, work orders, final status
- **[Manager Channel]** — Review and approval
- **[Vendor Channel]** — Approved job and delivery result
- **[Reporting Tool]** — Volume, status, and exceptions

WHERE IT RUNS	**[Client Cloud] or approved managed cloud**	Separate from the PMS and connected through controlled credentials.
SYSTEM OF RECORD	**[Client PMS]**	Residents, properties, work orders, assignments, and final status remain here.
HUMAN CONTROL	**Managers and approved staff**	Vendor choice, spend, legal cases, appointments, and closure stay with people.

Assumptions to confirm

- [Client PMS] can share data through an API, export, webhook, or notification email.
- [Vendor Channel] can accept a PMS task, API call, portal action, or email.
- [Manager Channel] can receive a secure link or approval action.
- The client approves hosting, data fields, retention, and user access.

NEXT STEP

Map this system to your actual tools

A short working call can confirm the available connections and the first useful version.
