MAINTENANCE REQUEST TRIAGE

What your manager receives

For [Client Company] / [Decision Maker]

A request with the key details gathered, missing information followed up, and the next action ready for a person to review.

ILLUSTRATIVE MANAGER VIEW

Kitchen sink leak

Reported: Water is still flowing and spreading.

Access: Entry permitted. Dog in the unit.

Review urgency / Hold / Select vendor

Less time rebuilding the story. A clearer handoff to the manager.

Your team still controls vendor contact, spending, appointments, and closure.

ONE REQUEST, END TO END

From report to approved action

Illustrative case - not a customer result.

1

RESIDENT

Reports the leak

"Water is spreading under my kitchen sink. It is still flowing. You can enter, but there is a dog."

2

SYSTEM + RESIDENT

Asks only what is missing

"When did it start?"
"About ten minutes ago." The reply stays with this request.

3

SYSTEM

Prepares the manager view

Links the unit and history; checks safety; gathers eligible vendor options. Known access and pet details are kept.

4

MANAGER

Decides what happens next

Reviews the original message and urgency reason, then holds, changes, or approves vendor contact.

5

SYSTEM

Sends and records the result

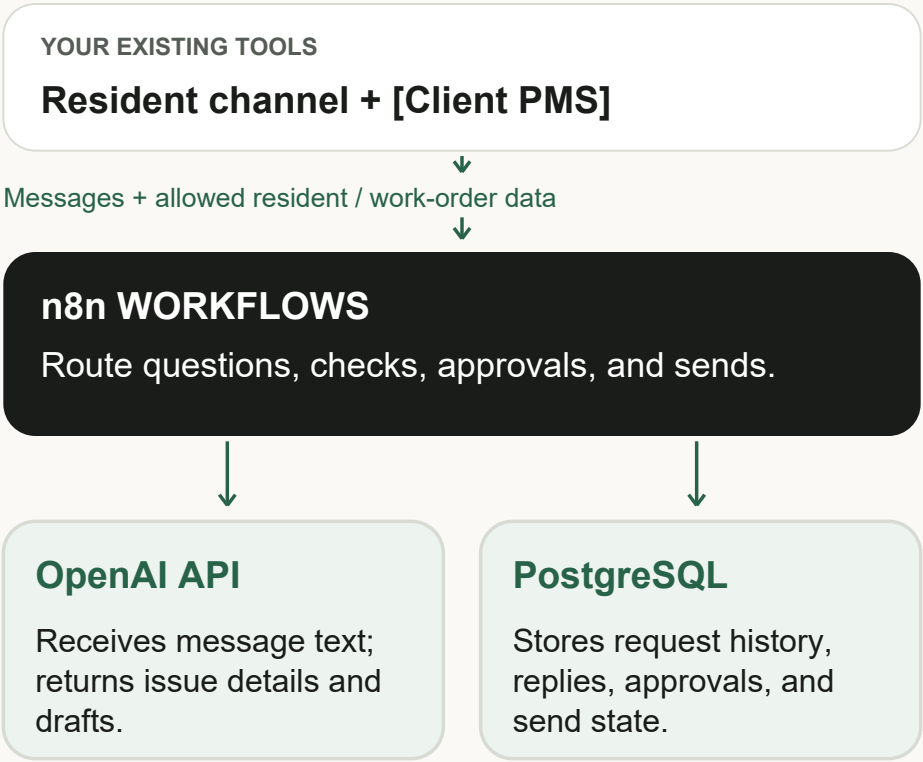

Contacts the selected vendor once. Updates the resident only after the send succeeds - no invented arrival time.

Safety alerts must not wait for clarification. Sensitive or unclear cases go to a person.

SOFTWARE AND CONNECTIONS

What I would add

Proposed client setup. Connections depend on your software access and permissions.

Back through n8n: manager decisions, approved vendor messages, and allowed PMS updates.

Fixed safety rules are separate from AI. People approve vendor contact.

Hosting: n8n + PostgreSQL on a client-owned server. OpenAI runs as an external API service.

FIT WITH YOUR BUSINESS

Agree the connections. Keep the decisions.

01 Start with your intake

Choose the existing mailbox or resident channel. Confirm identity checks and the data it can share.

02 Connect the review and work record

Route prepared requests to your manager channel. Write approved results to the PMS where access allows; otherwise use a staff-reviewed task.

03 Set the rules with your team

You choose questions, vendor eligibility, approval limits, and access. I configure the connections; we agree hosting, backups, and support.

Current build: a local demo using Gmail, Telegram, and Airtable with n8n, PostgreSQL, and OpenAI. PMS integration and production deployment are still to be built for the client.

See one request in the demo.

Then discuss your intake and PM platform.
