Three rules in this system that look absurd out of context.

And the live run that produced each one.

RULE 1

a ceiling fan that stopped working is a routine appliance job.

Not ~~electrical~~.

The model said electrical. Defensible: a fan uses electricity. The roster's electrician covers one property. This came from another.

Zero

vendor matches.

RULE 2

a ceiling drip with a bucket under it stays urgent.

It does not become ~~an emergency~~.

Repeated runs escalated contained drips to emergency.

Spreading water, ceiling collapse and electrical risk still do. The bucket is the signal that it's contained.

RULE 3

a squeaky door is routine.

Unless it won’t lock, won’t close, blocks access, or can injure someone.

Runs drifted on noisy hinges.

The exception list is the whole rule. A door that won't lock is a security problem, not ~~a noise complaint~~.

Ask any AI vendor how many of these they have, and how they found them.

A list nobody can produce means nothing has run against *reality.*
