AUTOMATION SYSTEMS

PREPARED FOR
[Client Company] / [Decision Maker]

01

MAINTENANCE REQUEST TRIAGE AND COORDINATION

What changes in the current process

The system connects the tools your team already uses. It removes manual sorting and lookup work, then gives the manager a prepared decision. Your PMS, manager, and vendor process stay in control.

Today

Most steps depend on a coordinator

EXISTING
Resident channels
Portal, email, SMS, phone

message →

MANUAL
~~Read and sort~~
Staff checks every message

copy + lookup →

MANUAL
~~Build context~~
PMS, policy, vendor search

summary →

EXISTING
Manager decision
Approve, hold, assign

action →

EXISTING
PMS + vendor channel
Work order and dispatch

MANUAL STEPS REMOVED — NEW CONNECTED STEPS ADDED

After integration

Systems pass the request forward; people handle the decision

STAYS
Resident channels
Same portal, email, SMS, phone

API / mailbox →

ADDED
Intake connector
Captures message and identity

request event →

ADDED
Workflow + AI + rules + database
Links the unit, checks the issue, asks for missing details, and prepares choices

decision pack →

STAYS
Manager decision
Approve, hold, edit, assign

approved action →

STAYS
PMS + vendor channel
Confirmed work is written and sent

- ☐ **Stays**
  Resident channels, [Client PMS], manager approval, vendor process, and final closure.
- ☐ **Removed**
  Reading each message, copying details, checking the same records, and building a manager summary by hand.
- ☐ **Added**
  Secure connectors, workflow logic, an AI model, fixed policy rules, an operations database, and retries.

Assumption used on this page — [Client Company] already has resident intake channels, a PMS, a manager approval path, and a vendor contact method. The exact tools are confirmed before the final design.

02

ONE REQUEST, FROM MESSAGE TO CONFIRMED ACTION

How the parts work together

The example below shows the actors, the software, and the information passed at each step.

RESIDENT REPORT

"Water is spreading under the kitchen sink. The tap is off, but water is still coming out. My dog is inside. You may enter."

1 EXISTING

Resident channel

[SMS Provider], portal, email, or voicemail receives the report.

Message + sender ID

Webhook, API, or secure mailbox →

2 ADDED

AI model reads the issue + **Fixed rules** raise water priority + **Database** links unit and history

Coordination workflow

Builds one record, checks access and pet details, and finds eligible plumbers.

Summary + reason + choices

Manager alert with PMS link →

3 EXISTING

Manager decides

The manager reviews the reason and selects the approved plumber.

Approved action

Nothing is sent to a vendor before this human approval

ADDED

Workflow claims the action once

Stops a second click from sending a duplicate

API / email / PMS →

EXISTING

[Vendor Channel]

Receives the approved job

delivery result →

EXISTING

[Client PMS] + resident channel

Get the confirmed status only

WHAT THIS CHANGES

For the operations team

01 Urgent issues reach the right manager sooner.

02 Requests arrive with the key details already prepared.

03 One request leads to one tracked vendor action.

04 Residents receive updates based on confirmed events.

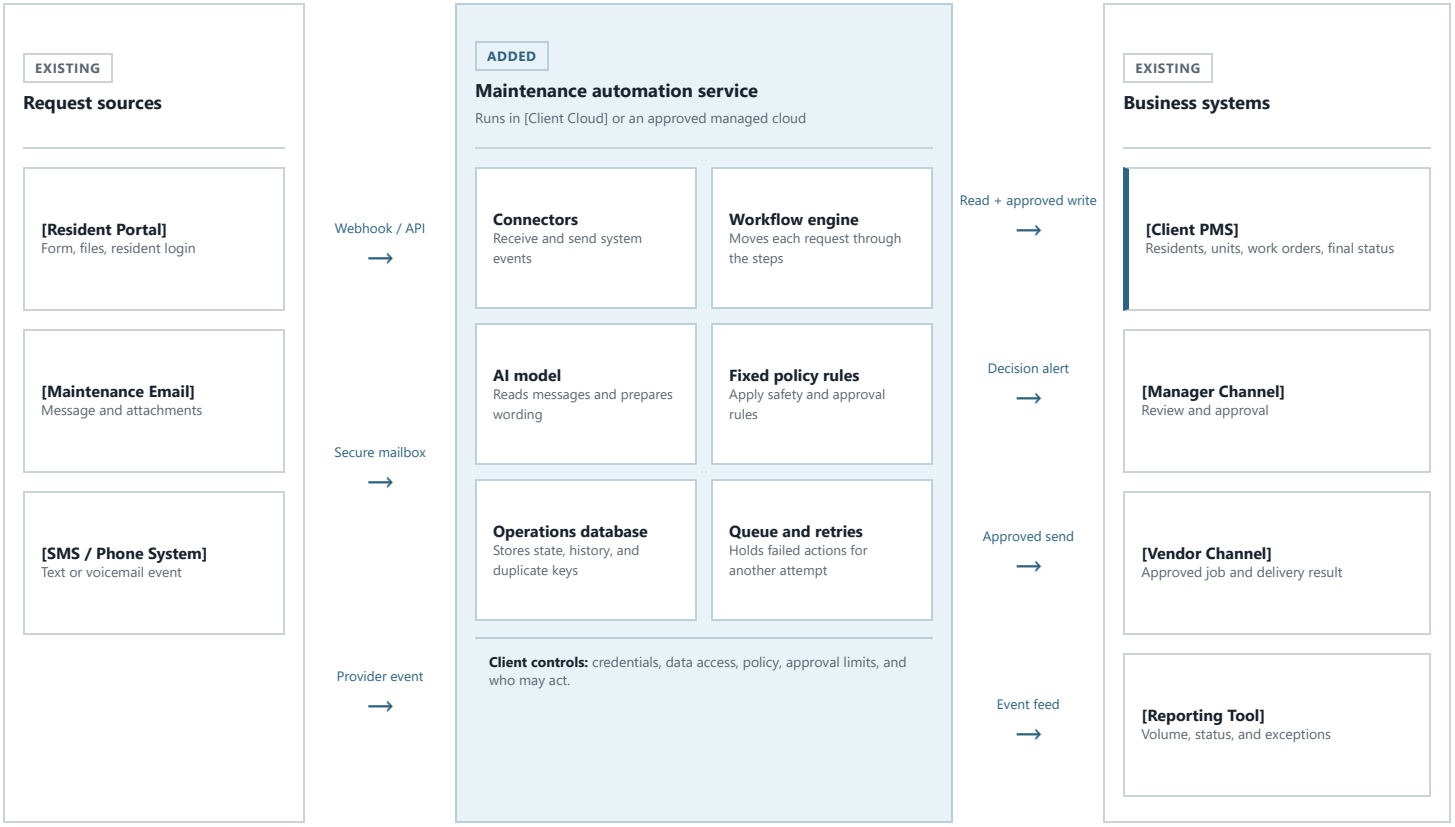

If a step fails: The request stays open. The database records the failed step, retries safe technical actions, and sends the case to a person when needed.

03

A PRACTICAL CONNECTION MAP

How it fits into the running business

The new service runs between the tools you already use. It reads allowed data, prepares work, and writes back only through approved connections.

WHERE IT RUNS

[Client Cloud] or approved managed cloud

The service is separate from the PMS but connects through controlled credentials.

SYSTEM OF RECORD

[Client PMS]

Residents, properties, work orders, assignments, and final status remain here.

HUMAN CONTROL

Managers and approved staff

Vendor choice, spend, legal cases, appointments, and closure stay with people.

Assumptions used for this connection map

- [Client PMS] can share data through an API, export, webhook, or notification email.
- [Manager Channel] can receive a secure link or approval action.
- [Vendor Channel] can accept a PMS task, API call, portal action, or email.
- The client approves the hosting choice, data fields, retention rules, and user access.

NEXT STEP

Map this system to your actual tools

A short working call can confirm which connections are possible, what stays manual, and what the first useful version should cover.
