MAINTENANCE REQUEST TRIAGE AND COORDINATION

Maintenance work, prepared before it reaches the manager.

The same resident channels, PMS, and decision owners remain. The work between first message and informed decision changes.

PREPARED AFTER REVIEWING

- [Company website]
- [Portfolio / markets]
- [Current tools or hiring signals]

PERSONAL NOTE FOR [CLIENT COMPANY]

[A specific observation about their maintenance operation]

From the public information I reviewed, your team appears to manage **[verified operating detail]** through **[known channels or PMS]**. The clearest fit is **[observed coordination problem]**. This system would connect the current intake path to **[Client PMS]**, so **[specific role]** receives a complete decision instead of rebuilding the context by hand.

Use only verified facts. Keep the final note to 55-80 words.

WHAT STAYS

One business process

Resident channels feed the process. Managers decide. The PMS and vendor channel record the confirmed action.

EXISTING		EXISTING		EXISTING
Resident channels Portal, email, SMS, phone	Request	**Manager decision** Approve, hold, edit, assign	Confirmed action	**PMS + vendor channel** Record, send, and track

TODAY: MANUAL PREPARATION

~~Read every message~~ / ~~chase missing details~~ / ~~search records and vendors~~ / ~~build the summary~~

Replaced by ↓

ADDED: SYSTEM PREPARATION

Connect
Message, resident, unit, open work

Clarify
Ask one focused follow-up if needed

Prepare
AI, fixed rules, history, vendor options

Human control stays in place. Vendor contact, spending, sensitive cases, appointments, commitments, and closure remain authorized decisions.

HOW ONE REQUEST MOVES THROUGH THE BUSINESS

The request gets clearer at every handoff.

The system prepares the work. A manager still decides whether anything is sent to a vendor.

RESIDENT REPORT

"Water is spreading under the kitchen sink. The tap is off, but water is still coming out. My dog is inside. You may enter."

1

RECEIVE

Connect the message to the right request

Keep the resident's exact words. Match the resident, unit, conversation, and open work. Attach follow-ups instead of creating duplicates.

Request record
Original message + trusted context

2

INTERPRET

Read the issue, then apply fixed policy

AI structures the symptom, trade, urgency, access, and pet details. Separate safety rules may raise urgency, but never lower it.

Risk checked
AI recommendation + rule result

3

CLARIFY

Ask only for what is missing

The question returns through the resident's existing channel. Their reply joins the same request and the urgency check runs again.

EXAMPLE FOLLOW-UP

"Is the water still flowing after the shutoff?"

Reply returns to this request

4

HUMAN CHECKPOINT

Present one complete manager decision

Show the original message, urgency reason, property context, approval need, and eligible actions. The manager may approve, hold, edit, or assign.

Manager
Authorizes the action

5

CONFIRMED HANDOFF

Send once, then update the record

A single-use claim prevents duplicate dispatch. The resident is told a provider was contacted only after the vendor message succeeds.

Confirmed state
PMS updated + vendor delivery recorded

When the request does not follow the main path

The work stays visible and returns to a named person.

Missing detail
Ask the resident, then reassess.

Sensitive or uncertain
Pause and assign human review.

No vendor or failed send
Keep open and show the exception.

Operational result

Less intake work, earlier risk visibility, fewer duplicate actions, and resident updates based only on confirmed state.

HOW IT CONNECTS TO THE CURRENT BUSINESS

One added service between the request and the decision.

The client keeps its channels, PMS, vendor process, and authority. The added service connects them through approved interfaces.

ALREADY IN USE

Resident request sources

- **[Resident Portal]** — Form, files, verified login
- **[Maintenance Email]** — Message and attachments
- **[SMS / Phone System]** — Text or voicemail event

Webhook, API, secure mailbox, or provider event ↓

ADDED SERVICE

Maintenance coordination service

Runs in [Client Cloud] or an approved managed cloud. It has no independent authority to dispatch or spend.

- **Connectors** — Receive and send approved events
- **Conversation state** — Keep questions and replies together
- **AI + fixed rules** — Interpret the issue and apply policy
- **Audit + retries** — Prevent duplicates and expose failures

Client controls: credentials, allowed data, policies, approval limits, retention, and who may act.

APPROVED READ AND WRITE

[Client PMS]

Provides resident, unit, open work, and vendor context. Receives the prepared or confirmed work-order state.

System of record

DECISION ALERT

[Manager Channel]

Review, hold, edit, approve, or assign.

Human authority

Only after approval ↓

APPROVED SEND

[Vendor Channel]

Receives the confirmed job. Delivery result returns to the request.

External action

RECORDED EVENTS — **[Reporting Tool]** — Volume, status, wait states, failures, and exceptions appear in the client's existing reporting process.

WHERE IT RUNS	WHAT REMAINS AUTHORITATIVE	WHO CONTROLS MATERIAL DECISIONS
[Client Cloud] or approved managed cloud	**[Client PMS] for residents, work orders, and final status**	**Managers and approved client staff**

Assumptions to confirm — [Client PMS] connection method, manager approval channel, vendor delivery route, hosting, data access, retention, and user permissions.

NEXT STEP

Map this system to your actual tools.

A short working call can confirm the available connections and the first useful version.
