MAINTENANCE REQUEST TRIAGE AND COORDINATION

What changes in the *current process.*

The system connects the tools your team already uses, removes manual sorting and lookup work, and gives the manager a prepared decision.

PREPARED AFTER REVIEWING

- [Company website]
- [Portfolio / markets]
- [Current tools or hiring signals]

A NOTE FOR [CLIENT COMPANY]

[A specific observation about their maintenance operation]

From the public information I reviewed, your team appears to manage **[verified portfolio or operating detail]** through **[known intake channels or PMS]**. The clearest fit for this system is **[observed coordination problem]**. It would connect the current intake path to **[Client PMS]**, so **[specific role]** receives a complete decision instead of rebuilding the context by hand.

Personalization template: use only verified facts. Keep this note to 55-80 words and save the public source links in your research notes.

01 Today

Most steps depend on a coordinator

EXISTING
Resident channels
Portal, email, SMS, phone

→ message

MANUAL
~~**Read and sort**~~
Staff checks every message

→ copy + lookup

MANUAL
~~**Build context**~~
PMS, policy, vendor search

→ summary

EXISTING
Manager decision
Approve, hold, assign

→ action

EXISTING
PMS + vendor channel
Work order and dispatch

MANUAL WORK REMOVED — CONNECTED STEPS ADDED

02 After integration

Systems prepare; people decide

STAYS
Resident channels
Same portal, email, SMS, phone

→ API / mailbox

ADDED
Intake connector
Captures message and identity

→ request event

ADDED
Workflow + AI + rules + database
Links the unit, checks the issue, and prepares choices

→ decision pack

STAYS
Manager decision
Approve, hold, edit, assign

→ approved action

STAYS
PMS + vendor channel
Confirmed work is written and sent

- **Stays**
  Channels, PMS, manager approval, vendor process
- **Removed**
  Reading, copying, lookup, summary building
- **Added**
  Connectors, workflow, AI, rules, database, retries

ONE REQUEST, FROM MESSAGE TO CONFIRMED ACTION

How the parts *work together.*

The example shows the actors, the software, and the information passed at each step.

RESIDENT REPORT

"Water is spreading under the kitchen sink. The tap is off, but water is still coming out. My dog is inside. You may enter."

01 EXISTING

Resident channel

[SMS Provider], portal, email, or voicemail receives the report.

Message + sender ID

Webhook, API, or secure mailbox →

02 ADDED

AI model reads the issue + **Fixed rules** raise water priority + **Database** links unit and history

Coordination workflow

Builds one record, checks access and pet details, and finds eligible plumbers.

Summary + reason + choices

Manager alert with PMS link →

03 EXISTING

Manager decides

The manager reviews the reason and selects the approved plumber.

Approved action

Nothing is sent to a vendor before this human approval

ADDED

Workflow claims the action once

Stops a second click from sending a duplicate

API / email / PMS →

EXISTING

[Vendor Channel]

Receives the approved job

delivery result →

EXISTING

[Client PMS] + resident channel

Get the confirmed status only

WHAT THIS CHANGES

For the operations team

01 Urgent issues reach the right manager sooner.

02 Requests arrive with key details prepared.

03 One request leads to one tracked vendor action.

04 Residents receive only confirmed updates.

If a step fails The request stays open. The database records the failed step, retries safe technical actions, and sends the case to a person when needed.

A PRACTICAL CONNECTION MAP

How it fits into the *running business.*

The new service runs between the tools you already use. It reads allowed data, prepares work, and writes back only through approved connections.

EXISTING

Request sources

[Resident Portal]
Form, files, resident login

[Maintenance Email]
Message and attachments

[SMS / Phone System]
Text or voicemail event

Webhook / API →

Secure mailbox →

Provider event →

ADDED

Maintenance automation service

Runs in [Client Cloud] or an approved managed cloud

Connectors
Receive and send events

Workflow engine
Moves each request

AI model
Reads and prepares wording

Fixed rules
Apply safety and approval policy

Operations database
Stores state and duplicate keys

Queue and retries
Holds failed actions

Client controls: Credentials, data access, policy, approval limits, and who may act.

Read + approved write →

Decision alert →

Approved send →

Event feed →

EXISTING

Business systems

[Client PMS]
Residents, units, work orders, final status

[Manager Channel]
Review and approval

[Vendor Channel]
Approved job and delivery result

[Reporting Tool]
Volume, status, exceptions

WHERE IT RUNS

[Client Cloud] or approved managed cloud
Separate from the PMS, connected through controlled credentials.

SYSTEM OF RECORD

[Client PMS]
Residents, properties, work orders, assignments, and final status remain here.

HUMAN CONTROL

Managers and approved staff
Vendor choice, spend, legal cases, appointments, and closure stay with people.

ASSUMPTIONS TO CONFIRM

- [Client PMS] can share data through an API, export, webhook, or notification email.
- [Vendor Channel] can accept a PMS task, API call, portal action, or email.
- [Manager Channel] can receive a secure link or approval action.
- The client approves hosting, data fields, retention, and user access.

NEXT STEP

Map this system to your actual tools.

A 15-minute working call can confirm which connections are possible, what stays manual, and what the first useful version should cover.
