AUTOMATION SPECIALIST

AI AUTOMATION FOR PROPERTY MANAGEMENT

Maintenance work that arrives *ready for a decision.*

A practical automation layer for **Highland Property Group** that reads incoming requests, checks for safety risks, gathers missing details, and prepares the next action - while your team keeps final control.

PREPARED FOR
Marcus Vance, VP of Operations

DESIGNED AROUND
AppFolio / Existing PM System

THE OPERATIONAL SHIFT

Your team keeps the judgment. The system handles the legwork.

01 **Sort the signal from the noise**
Every request is normalized into the same readable structure, whether it began as an email, form, text, or transcript.

02 **Surface risk before it waits in an inbox**
Explicit safety rules raise water, gas, electrical, heat-loss, and life-safety signals for immediate human attention.

03 **Bring managers a complete decision**
Routine requests collect missing context and eligible vendor options before the manager is asked to approve anything.

- Nothing sends without approval
- Existing tools stay in place
- Every decision leaves an audit trail

FROM REQUEST TO APPROVED ACTION

One calm workflow, from first message to final handoff.

The automation prepares and explains the next step. It does not replace the manager who authorizes it.

INTAKE

01

Capture and match the request

Normalize the message, identify the resident and unit, and connect replies to the same open issue.

Clean request

TRIAGE

02

Interpret the issue and check safety

Extract trade, symptoms, urgency, and missing information. Deterministic rules can only raise priority, never suppress it.

Risk checked

CLARIFY

03

Ask only for what is missing

Collect access notes, photos, pet details, or a clearer symptom without making staff chase the resident.

Context ready

HUMAN CHECKPOINT

04

Present one clear manager decision

Show the summary, urgency, proposed vendor, and reason. The manager approves, holds, or changes the action.

Manager control

HANDOFF

05

Send once, then update the record

A single-send lock prevents duplicate dispatch. Resident status changes only after the approved vendor message succeeds.

Audited send

Built for messages that do not fit the happy path

Emergency language

Fast-track the alert and keep the manager in the loop.

Unclear request

Ask a focused follow-up before creating noise.

Sensitive or legal context

Pause automation and route to human review.

WHAT CHANGES - AND WHAT DOES NOT

A new coordination layer, *not another system to replace.*

Your team keeps its property management platform, vendor relationships, and approval authority. The automation sits between incoming work and the next human decision.

WHAT STAYS YOURS

- **Your property management system**
  Lease, unit, work-order, and accounting records remain in the existing system of record.
- **Your vendors and commercial rules**
  Approved trades, service areas, rates, and not-to-exceed limits remain business decisions.
- **Your final sign-off**
  Managers decide whether a work order is dispatched, held, or changed.

+

WHAT GETS ADDED

- **Orchestration**
  A 24/7 workflow that receives, routes, and records incoming requests.
- **Structured interpretation**
  AI extracts the issue; explicit rules protect known safety boundaries.
- **Durable state and approvals**
  A database keeps conversation, approval, send, and audit state consistent.

A STAGED PATH TO LIVE USE

Three weeks, with a proof point each week.

WEEK 01
Map
Confirm channels, vendor rules, safety boundaries, and approval ownership.

WEEK 02
Shadow
Run on real examples without sending, then compare results with coordinator decisions.

WEEK 03
Adopt
Enable manager approvals, document exceptions, and hand over the operating runbook.

THE PRACTICAL NEXT STEP

15-Minute Technical Feasibility Alignment

If this concept addresses a tangible bottleneck in your operation, we spend 15 minutes reviewing your current intake channels and PM software setup to confirm practical feasibility. Zero sales pitch, no commitment.
