MAINTENANCE REQUEST TRIAGE AND COORDINATION

What changes in the *current process.*

The tools and decision owners stay in place. Manual reading, follow-up, and context building move into one controlled workflow.

RESEARCH REVIEWED

- [Company website]
- [Portfolio / markets]
- [Current tools or hiring signals]

PERSONAL NOTE FOR [CLIENT COMPANY]

[A specific observation about their maintenance operation]

From the public information I reviewed, your team appears to manage **[verified operating detail]** through **[known channels or PMS]**. The clearest fit is **[observed coordination problem]**. This system would connect the current intake path to **[Client PMS]**, so **[specific role]** receives a complete decision instead of rebuilding the context by hand.

Use only verified facts. Keep the final note to 55-80 words.

TODAY

Coordinator-led process

Manual work

EXISTING
Resident channels receive the request
Portal, email, SMS, or phone.

Message arrives ↓

MANUAL
~~Staff reads, sorts, and links it~~
Identity, unit, thread, and duplicates are checked.

Details missing ↓

MANUAL
~~Staff follows up with the resident~~
Access, photos, pet notes, or a clearer symptom.

Context incomplete ↓

MANUAL
~~Staff searches policy, history, and vendors~~
The decision is assembled by hand.

Summary ready ↓

EXISTING
Manager decides and the team executes
Approval, PMS, and vendor process stay in place.

Preparation automated →

AFTER INTEGRATION

System-prepared process

People decide

STAYS
The same resident channels remain
No new resident app is required.

API, webhook, or mailbox ↓

ADDED
Intake connector builds one request
Message, sender, unit, thread, and open work are linked.

If information is missing ↓

ADDED
System asks focused follow-up questions
One at a time. Replies return to the same request.

Reply saved and urgency rechecked ↓

ADDED
AI, fixed rules, and data prepare choices
Safety rules stay separate and may only raise urgency.

Prepared decision ↓

STAYS
Manager approves; confirmed work is sent
Human control, PMS, and vendor process remain.

- **Stays** — Existing channels, PMS, and human approval
- **Removed** — Manual reading, chasing, copying, and lookup
- **Added** — Connectors, clarification, workflow, rules, and state

FROM REQUEST TO APPROVED ACTION

One calm workflow, from first message to *final handoff.*

The automation prepares and explains the next step. It does not replace the manager who authorizes it.

RUNNING EXAMPLE Active sink leak · water still flowing · dog inside · permission to enter

INTAKE

01 **Capture and match the request**

Preserve the exact message, identify the resident and unit, and connect replies to the same open issue.

Request connected

TRIAGE

02 **Interpret the issue and check safety**

Extract trade, symptoms, urgency, and missing information. Fixed rules can only raise priority, never suppress it.

Risk checked

CLARIFY

03 **Ask only for what is missing**

Ask one approved follow-up at a time. Save each reply to the same request and run the urgency check again.

Known access and pet details are not asked again.

Context ready

HUMAN CHECKPOINT

04 **Present one clear manager decision**

Show the original message, urgency reason, property context, approval need, and eligible actions.

Manager control

HANDOFF

05 **Send once, then update the record**

A single-use approval prevents duplicate dispatch. Resident status changes only after the approved vendor message succeeds.

Audited send

Built for messages that do not fit the happy path

- **Emergency language**
  Fast-track the alert and keep the manager in the loop.
- **Unclear request**
  Ask a focused follow-up before creating noise.
- **Sensitive or legal context**
  Pause automation and route to human review.
- **Failed connection**
  Keep the request open and show the unsynchronized step.

WHAT CHANGES

For the operations team

01 Urgent issues reach the right manager sooner.

02 Staff stop chasing routine missing details.

03 One request leads to one tracked vendor action.

04 Residents receive only confirmed updates.

If a step fails The request stays open, the failed step is recorded, and the case is routed to a person when needed.

A PRACTICAL CONNECTION MAP

A coordination layer, *not another system to replace.*

The service runs between the tools already in use. It reads allowed data and writes back only through approved connections.

EXISTING Request sources

[Resident Portal]
Form, files, login

[Maintenance Email]
Message and attachments

[SMS / Phone System]
Text or voicemail event

Webhook / API →

Secure mailbox →

Provider event →

ADDED Maintenance automation service

Runs in [Client Cloud] or an approved managed cloud

Connectors
Receive and send events

Workflow engine
Moves each request

Conversation state
Keeps follow-up replies together

AI + fixed rules
Interpret issue and apply policy

Operations database
Stores state and duplicate keys

Queue and retries
Expose and retry failed actions

Client controls Credentials, allowed data, policy, approval limits, retention, and who may act.

Approved read / write →

Decision alert →

Approved send →

Event feed →

EXISTING Business systems

[Client PMS]
Residents, units, work orders, final status

[Manager Channel]
Review and approval

[Vendor Channel]
Approved job and delivery result

[Reporting Tool]
Volume, status, exceptions

WHERE IT RUNS

[Client Cloud] or approved managed cloud

Separate from the PMS and connected through controlled credentials.

SYSTEM OF RECORD

[Client PMS]

Residents, work orders, assignments, and final status remain here.

HUMAN CONTROL

Managers and approved staff

Vendor choice, spend, legal cases, appointments, and closure stay with people.

Assumptions to confirm

- [Client PMS] can share data through an API, export, webhook, or notification email.
- [Vendor Channel] can accept a PMS task, API call, portal action, or email.
- [Manager Channel] can receive a secure link or approval action.
- The client approves hosting, data fields, retention, and user access.

NEXT STEP

Map this system to your actual tools.

A short working call can confirm the available connections and the first useful version.
