MAINTENANCE REQUEST TRIAGE AND COORDINATION

What changes in the *current process.*

The tools and decision owners stay in place. Manual reading, follow-up, and context building move into one controlled workflow.

PERSONAL NOTE FOR [CLIENT COMPANY]

[A specific observation about their maintenance operation]

From the public information I reviewed, your team appears to manage **[verified operating detail]** through **[known channels or PMS]**. The clearest fit is **[observed coordination problem]**. This system would connect the current intake path to **[Client PMS]**, so **[specific role]** receives a complete decision instead of rebuilding the context by hand.

Use only verified facts. Keep the final note to 55-80 words.

TODAY — Coordinator-led process (Manual work)	AFTER INTEGRATION — System-prepared process (People decide)
EXISTING **Resident channels receive the request** Portal, email, SMS, or phone.	STAYS **The same resident channels remain** No new resident app is required.
Message arrives ↓	API, webhook, or mailbox ↓
MANUAL ~~**Staff reads, sorts, and links it**~~ Identity, unit, thread, and duplicates are checked.	ADDED **Intake connector builds one request** Message, sender, unit, thread, and open work are linked.
Details missing ↓	If information is missing ↓
MANUAL ~~**Staff follows up with the resident**~~ Access, photos, pet notes, or a clearer symptom.	Preparation automated → ADDED **System asks focused follow-up questions** One at a time. Replies return to the same request.
Context incomplete ↓	Reply saved and urgency rechecked ↓
MANUAL ~~**Staff searches policy, history, and vendors**~~ The decision is assembled by hand.	ADDED **AI, fixed rules, and data prepare choices** Safety rules stay separate and may only raise urgency.
Summary ready ↓	Prepared decision ↓
EXISTING **Manager decides and the team executes** Approval, PMS, and vendor process stay in place.	STAYS **Manager approves; confirmed work is sent** Human control, PMS, and vendor process remain.

- **Stays** — Existing channels, PMS, and human approval
- **Removed** — Manual reading, chasing, copying, and lookup
- **Added** — Connectors, clarification, workflow, rules, and state

FROM REQUEST TO APPROVED ACTION

One calm workflow, from first message to *final handoff.*

The automation prepares and explains the next step. It does not replace the manager who authorizes it.

RUNNING EXAMPLE Active sink leak · water still flowing · dog inside · permission to enter

01 INTAKE
Capture and match the request
Preserve the exact message, identify the resident and unit, and connect replies to the same open issue.
Request connected

02 TRIAGE
Interpret the issue and check safety
Extract trade, symptoms, urgency, and missing information. Fixed rules can only raise priority, never suppress it.
Risk checked

03 CLARIFY
Ask only for what is missing
Ask one approved follow-up at a time. Save each reply to the same request and run the urgency check again.

Known access and pet details are not asked again.
Context ready

04 HUMAN CHECKPOINT
Present one clear manager decision
Show the original message, urgency reason, property context, approval need, and eligible actions.
Manager control

05 HANDOFF
Send once, then update the record
A single-use approval prevents duplicate dispatch. Resident status changes only after the approved vendor message succeeds.
Audited send

Built for messages that do not fit the happy path

- **Emergency language**
  Fast-track the alert and keep the manager in the loop.
- **Unclear request**
  Ask a focused follow-up before creating noise.
- **Sensitive or legal context**
  Pause automation and route to human review.
- **Failed connection**
  Keep the request open and show the unsynchronized step.

WHAT CHANGES

For the operations team

01 Urgent issues reach the right manager sooner.

02 Staff stop chasing routine missing details.

03 One request leads to one tracked vendor action.

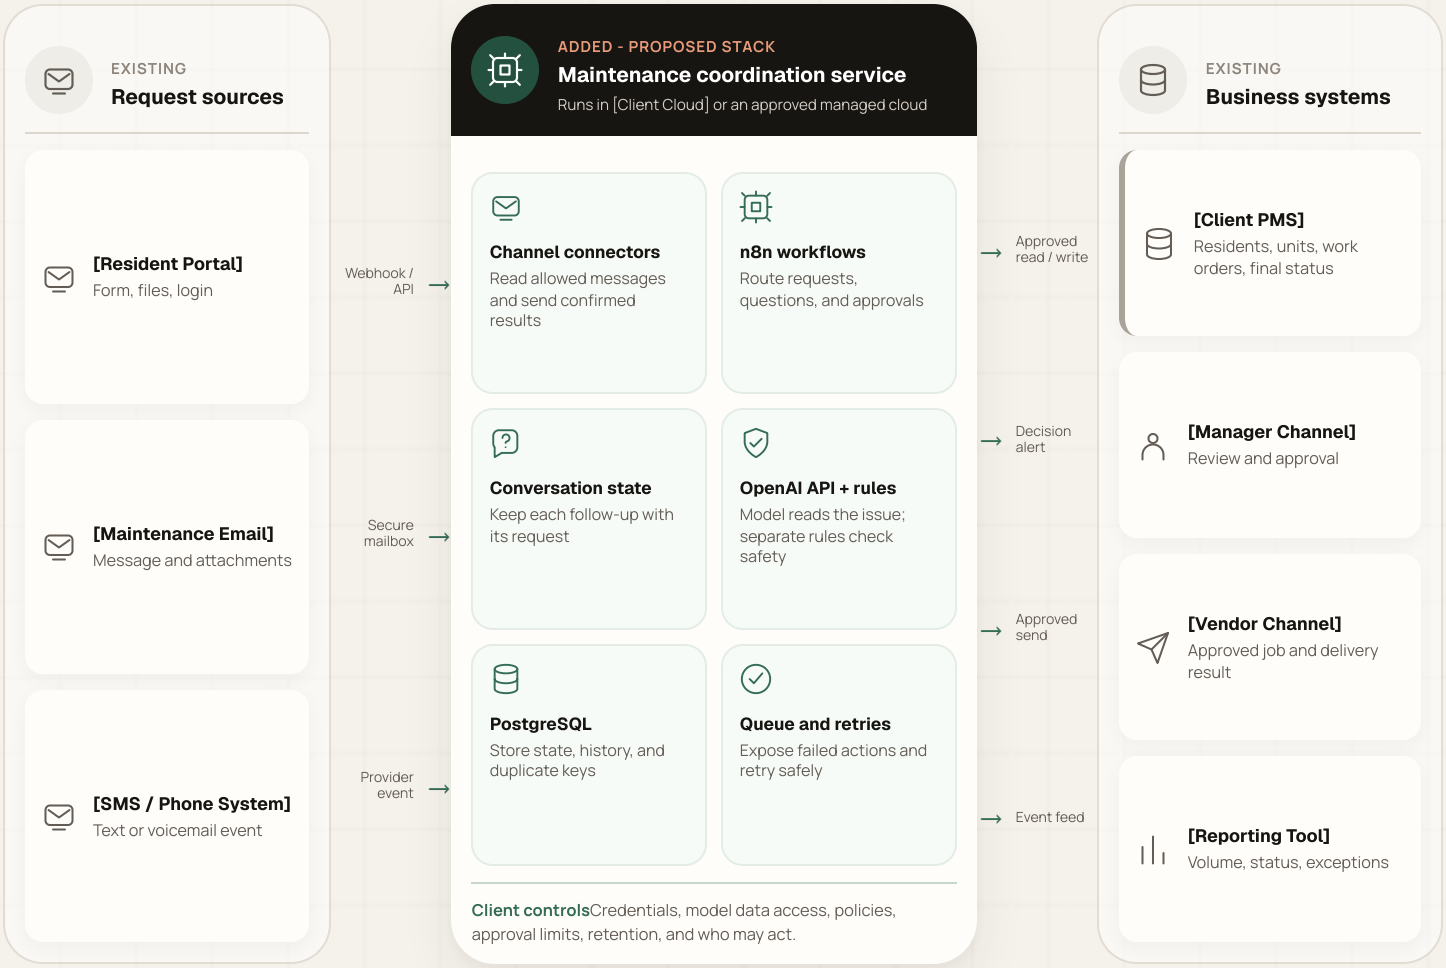

04 Residents receive only confirmed updates.

If a step fails The request stays open, the failed step is recorded, and the case is routed to a person when needed.

A PRACTICAL CONNECTION MAP

A coordination layer, *not another system to replace.*

Proposed build: n8n workflows, PostgreSQL for request history, and the OpenAI API for issue reading. Your PMS and communication channels connect through approved access.

WHERE IT RUNS

Client-owned cloud/VPS or approved host

n8n and PostgreSQL run separately from the PMS, with HTTPS and backups.

SYSTEM OF RECORD

[Client PMS]

Residents, work orders, assignments, and final status remain here.

HUMAN CONTROL

Managers and approved staff

Vendor choice, spend, legal cases, appointments, and closure stay with people.

Assumptions to confirm

- [Client PMS] permissions support an API, export, webhook, or notification-email route.
- [Vendor Channel] can accept a PMS task, API call, portal action, or email.
- [Manager Channel] can receive a secure link or approval action.
- The client approves hosting, OpenAI data use, retention, and user access.

NEXT STEP

Map this system to your actual tools.

A short working call can confirm the available connections and the first useful version.
