01 / WHAT CHANGES

# Maintenance requests, prepared for a decision.

For [Client Company] / [Decision Maker]

When requests arrive in pieces, staff have to collect the story before they can act. This system gathers the details, asks follow-up questions, and prepares the next action in the tools your team uses.

**The change: less preparation by hand.**
**Your team keeps the judgment.**

## From scattered messages

The system links reports and replies to one request, preserving the resident's original words.

## From chasing missing details

Approved follow-up questions collect what is missing. The manager receives the issue, access notes, history, and vendor options together.

## To a prepared human decision

Your manager reviews the urgency and chooses the action. Vendor contact, spending, and closure remain under your team's control.

**Keep your channels, PM platform, and vendor relationships.**

02 / FOLLOW ONE REQUEST

# The work between the message and the action.

Illustrative production journey

1

RESIDENT

## Reports an active leak

"Water is spreading under my kitchen sink. It is still flowing. You can enter, but there is a dog."

2

SYSTEM

## Checks the issue and alerts

Links the resident, unit, and open work. AI reads the message; fixed safety rules apply. An urgent safety alert does not wait for a reply.

3

SYSTEM + RESIDENT

## Clarifies without starting over

"When did it start?" / "Ten minutes ago."
The reply joins the same request. Known entry permission and pet details are not asked again.

4

MANAGER

## Reviews and approves

Reviews the prepared case and selects a vendor or holds the action. Any required owner approval comes before the send.

5

SYSTEM

## Sends, records, and updates

Sends the approved vendor request once. Records the send result, then updates the resident with confirmed status.

03 / TOOLS AND CONNECTIONS

# Connected to your business. Controlled by your team.

The production setup is configured around your PM platform, approved channels, and access.

EXISTING SYSTEMS

**Resident channels + [Client PMS]**

↓

Messages in; resident, unit, and work-order data read

↓

**n8n / workflow and fixed rules**

Connects the steps, questions, and approvals.

**OpenAI API**

Receives message text; returns issue details and drafts.

**PostgreSQL**

Keeps request history, replies, decisions, and send records.

↓

DECISIONS AND CONFIRMED RESULTS

**Manager channel:** prepared case out; approval back.

**Vendor channel:** approved request and send result.

**PMS:** work-order notes and confirmed status.

**Where it runs:** n8n and PostgreSQL on a client-owned cloud server; OpenAI is an external API service. PMS connections use the access your platform permits.

04 / WHAT YOUR TEAM GETS

# A complete handoff. A visible next action.

Illustrative outputs from the same kitchen leak

**MANAGER / READY TO REVIEW**

Active kitchen leak; water still flowing.
Entry permitted; dog in the unit.
Original report, urgency reason, and eligible plumbing vendors in one view.

**VENDOR / AFTER APPROVAL**

"Active kitchen leak at [Property / Unit]. Water is still flowing. Entry permitted; dog on site. Please confirm availability."

**TEAM / ONE SHARED RECORD**

Manager approval recorded. Vendor request sent. Awaiting vendor response. Resident informed that a provider has been contacted.

Less copying and chasing. Clearer decisions.
The resident gets a factual update after contact, not an appointment promise before confirmation.

**See how this fits your maintenance process.**
