01 / THE OPERATIONAL CHANGE

Less preparation work. Better-informed decisions.

Maintenance request triage and coordination for your existing operation.

PREPARED FOR

[Decision Maker]

[Client Company]

A NOTE FOR YOUR TEAM

After reviewing [verified company detail], I see a possible fit around [specific intake bottleneck]. This system would help [team or role] spend less time chasing details and more time deciding the next action.

TODAY / STAFF ASSEMBLE THE CONTEXT	WITH THE SYSTEM / STAFF DECIDE
Read each message	Capture and link the request
Chase the missing details	Ask focused follow-up questions
Search records and vendors	Prepare context and vendor options

What stays yours

Resident channels, the PMS, vendor relationships, and staff approval.

Intended result: less repeat handling, clearer urgency, and a prepared next step.

02 / ONE REQUEST, END TO END

From a resident message to a manager decision.

Illustrative example: a kitchen leak. Known access and pet details stay with the request.

1

RESIDENT REPORTS

"Water is spreading under the kitchen sink. It is still flowing with the tap off. My dog is here. You have permission to enter."

2

SYSTEM CHECKS AND CLARIFIES

Links the unit and flags spreading water under your safety rules. Alerts the on-call team without waiting for a reply.

If onset is missing: "When did the water start spreading?"

3

MANAGER REVIEWS / ILLUSTRATIVE PREVIEW

Kitchen leak | [Property / Unit]

Escalation: spreading water; flow continues.
Access allowed. Dog in unit. Plumbing vendor options ready.

Review original message / Hold / Select vendor

4

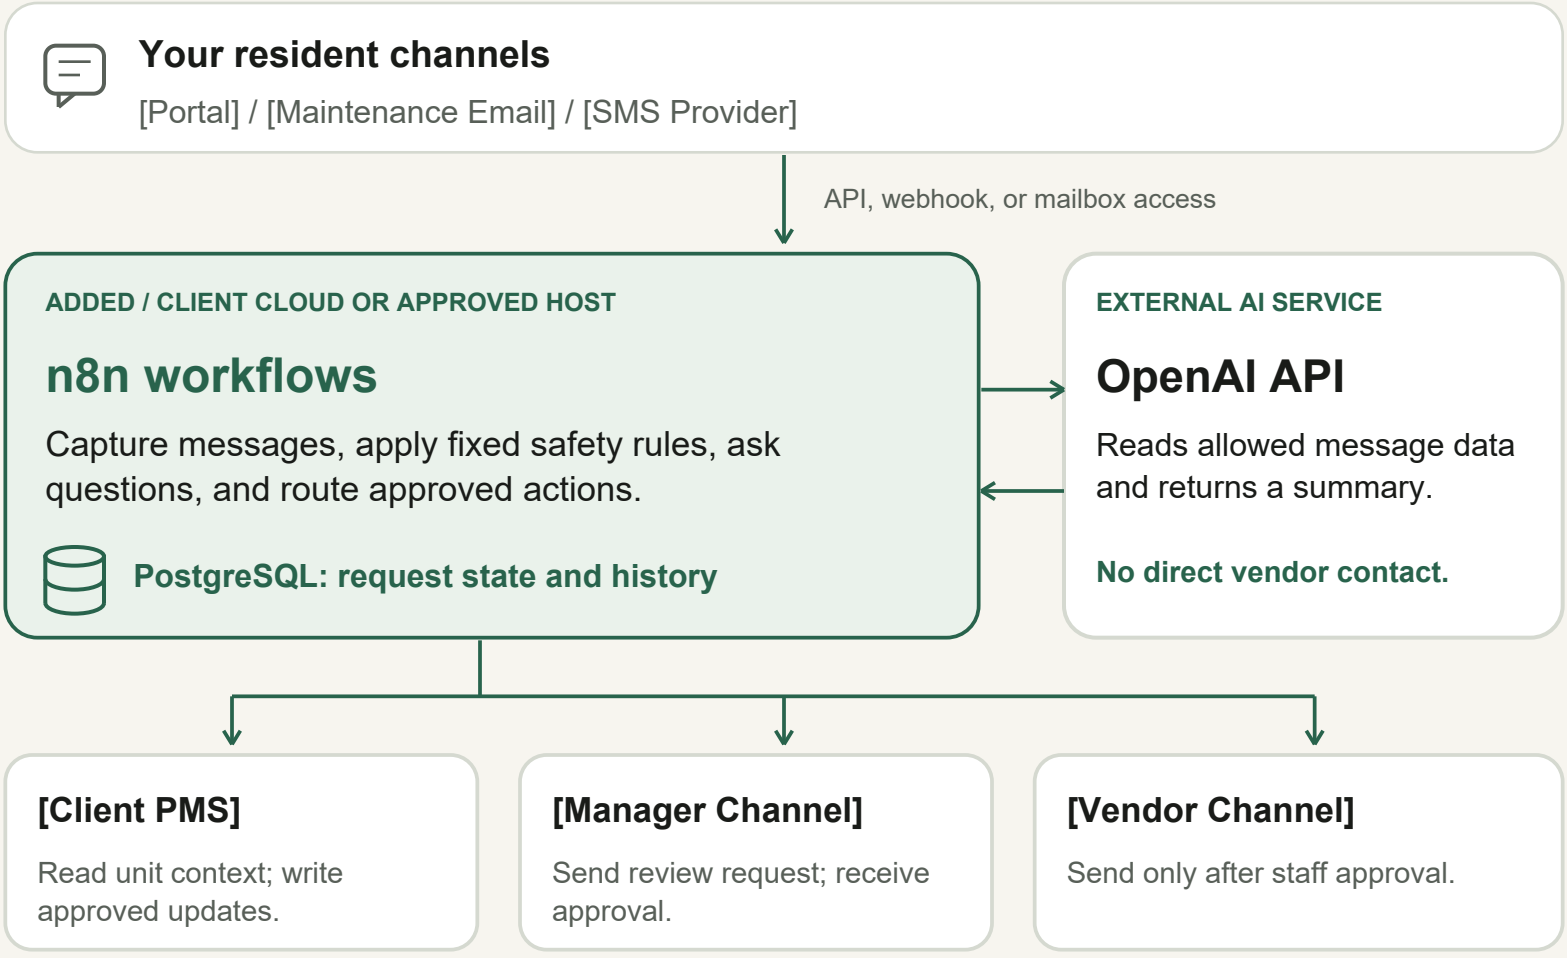

Approved action is sent and recorded.

The resident is told a provider was contacted only after the send succeeds. No invented arrival time.

03 / THE PROPOSED BUILD

Connected to your tools. Run in an approved environment.

Existing tools stay neutral. Green shows the software and connections I would add.

Connection routes depend on your PMS access. If writes are limited, prepare a task for staff instead. Hosting, credentials, and AI data use are agreed with you.

04 / CAPABILITY AND CONTROL

A working demo.
A client-specific implementation.

The core flow is built. Your PMS connection and production setup are separate work.

IMPLEMENTED IN THE LOCAL DEMO

Follow-up conversations

Missing details stay linked to the same request.

Manager-approved vendor email

Vendor options are shown; Hold sends nothing.

Duplicate-send protection

A repeated approval cannot claim a second send.

Demo tools: n8n, PostgreSQL, OpenAI, Airtable, Telegram, and email. These demo channels do not need to become your business tools.

Your team keeps the decision.

Spend, vendor choice, sensitive cases, appointments, and closure stay with staff. Failed sends remain visible; they do not become success updates.

Would this fit your maintenance process?

Bring your PMS and current intake setup.
