AI automation for property management

PREPARED FOR
[Client Company]

01 / What changes for your team

Maintenance requests, prepared.
Decisions stay with your team.

A production system that gathers details, prepares the next action, and tracks each handoff.

RESEARCH REVIEWED

[Company website]
[Portfolio / markets]
[Verified operating detail]

A NOTE FOR [DECISION MAKER]

Your [verified company detail] suggests a need to [specific operating goal]. I would connect [current intake] with [Client PMS] so [team] can review prepared requests instead of chasing the same details.

TODAY / REPEATED STAFF WORK		ADDED / SYSTEM PREPARATION
Read and match messages	→	Link resident, unit, and open work
Ask for missing information	→	Ask only what is still missing
Look up policy and vendors	→	Prepare eligible options and notes

WHAT STAYS **Your PMS, resident channels, vendor relationships, and approval authority.**

Less chasing. Clearer priorities. A visible owner and next action.

02 / How a request moves

From the first message to an approved action.

Illustrative production example: spreading water under a kitchen sink at 10:42 p.m.

"Water is spreading under the kitchen sink. The tap is off but it is still flowing. My dog is here. You have permission to enter."

1 **Match the request**

Verify resident and unit; keep the original message. Link repeats and replies.

2 **Interpret and check safety**

AI suggests urgency and trade.

Fixed rules: raise urgency; never lower it.

3 **Ask only what is missing**

Approved follow-up: "When did the water start spreading?" Reassess the reply.

4 **Prepare the human decision**

Safety alerts do not wait for clarification.

MANAGER RECEIVES

One prepared decision

Kitchen leak
[Property / Unit]

Spreading water; flow continues. Entry allowed. Dog in unit.

Original message, policy reason, vendor choices, and owner-approval need.

Review / hold / approve

After approval: claim the action once, update the PMS, and contact the vendor. Tell the resident only what the sending service confirms.

03 / What connects to what

Your existing tools.
A connected production service.

Proposed stack: n8n, PostgreSQL, and the OpenAI API. Exact routes follow your access and permissions.

Existing portal / email / SMS / phone transcripts

Resident messages in; approved questions and confirmed updates back.

API, webhook, or mailbox

CLIENT-OWNED OR APPROVED CLOUD

n8n workflows

Verify context; apply fixed rules; ask questions; route approvals; coordinate sends.

PostgreSQL stores state, audit history, queued work, and duplicate-action checks.

EXTERNAL SERVICE

OpenAI API

Receives limited, approved context. Returns the issue summary and draft wording.

No approval authority.

[Client PMS]

Resident and unit lookup; work orders and final status.

[Manager Channel]

Decision request out; authorized approval back.

[Vendor Channel]

Approved job out; replies and delivery status back.

PMS stays the business record. If write access is limited, return prepared tasks for staff. Connect owner approvals and reporting to the tools already in use.

04 / Daily operation and control

The process continues after the vendor is contacted.

Production scope includes progress tracking, failure handling, and a named person for exceptions.

IN YOUR PMS / SAME WORK ORDER

Vendor replies → **Time confirmed** → **Work progresses** → **Staff verify**

Quote or acceptance | Then update resident | Chase stalled work | Then close the job

YOUR TEAM CONTROLS

Approvals

Vendor choice, spend, owner approval, sensitive cases, and closure.

Access and data

Approved data fields, role-based access, retention, and protected credentials.

Policy and ownership

Your on-call rules and vendor criteria. A named operator owns service health.

THE SERVICE KEEPS WORK VISIBLE

Failed connection
Queue and retry. If it still fails, assign it to a person.

Conflicting or unclear data
Flag for review; never overwrite silently.

Service health
Monitor intake, reconcile PMS updates, and test encrypted backup recovery.

Map this to your operation.

Your channels, PMS access, approval rules, and hosting.
