A clearer path from report to repair.

Maintenance requests arrive ready for a human decision, with every handoff recorded.

Your team decides. The system prepares.

Collect missing details, surface risk and prepare the next action in the tools your business already uses.

TODAY

A raw inbox

Read, look up, rekey and chase details.

→

AUTOMATED PREPARATION

One prepared request

Summary, priority, context and vendor options.

→

HUMAN CONTROL

An informed next action

Review, hold, approve or assign manually.

Less intake admin

Reduce repetitive reading, copying and first-response preparation.

Earlier risk awareness

Route safety signals to the on-call role under your policy.

Fewer loose ends

Keep an owner, next action and visible waiting state on each request.

Resident updates

Report confirmed progress and keep follow-ups on the same request.

50 hours / month

ILLUSTRATION ONLY

1,000 requests × 3 minutes of intake work saved ÷ 60 = 50 hours.

Replace these assumptions with your measured pilot results. Capacity saved does not guarantee faster repairs.

Follow one maintenance request.

Proposed production flow. Connected channels and permitted actions are agreed during setup.

01 RECEIVE & CONNECT

Preserve the report; verify resident and unit. Link duplicates and replies to the existing request.

FOLLOW-UP OR STATUS?

Use the existing record. Answer with known facts; no duplicate ticket or invented ETA.

02 INTERPRET & APPLY POLICY

AI suggests summary, trade and urgency. Fixed safety rules may raise urgency, never lower it; sensitive cases go to staff.

SAFETY OR SENSITIVE CASE?

Safety: alert the on-call role without waiting for details. Sensitive or unusable output: trained staff review.

03 COMPLETE THE REQUEST

Ask approved questions for missing details. Reassess replies; prepare notes and eligible vendor options.

DETAILS STILL MISSING?

Ask resident → attach reply → reassess step 02. Hold vendor approval until ready or handled by a person.

04 HUMAN APPROVAL

Manager reviews, edits, holds or selects a vendor. Obtain owner approval when authority requires it.

HOLD / NO VENDOR / OWNER PENDING

Keep a visible task with the coordinator or property manager. No unapproved vendor contact.

05 CONTACT & CONFIRM

Claim the approved action once. Send through the vendor channel; record the confirmed send result.

SEND FAILED?

Retry under policy; coordinator owns the exception. Tell the resident “contacted” only after send succeeds.

06 TRACK, VERIFY & CLOSE

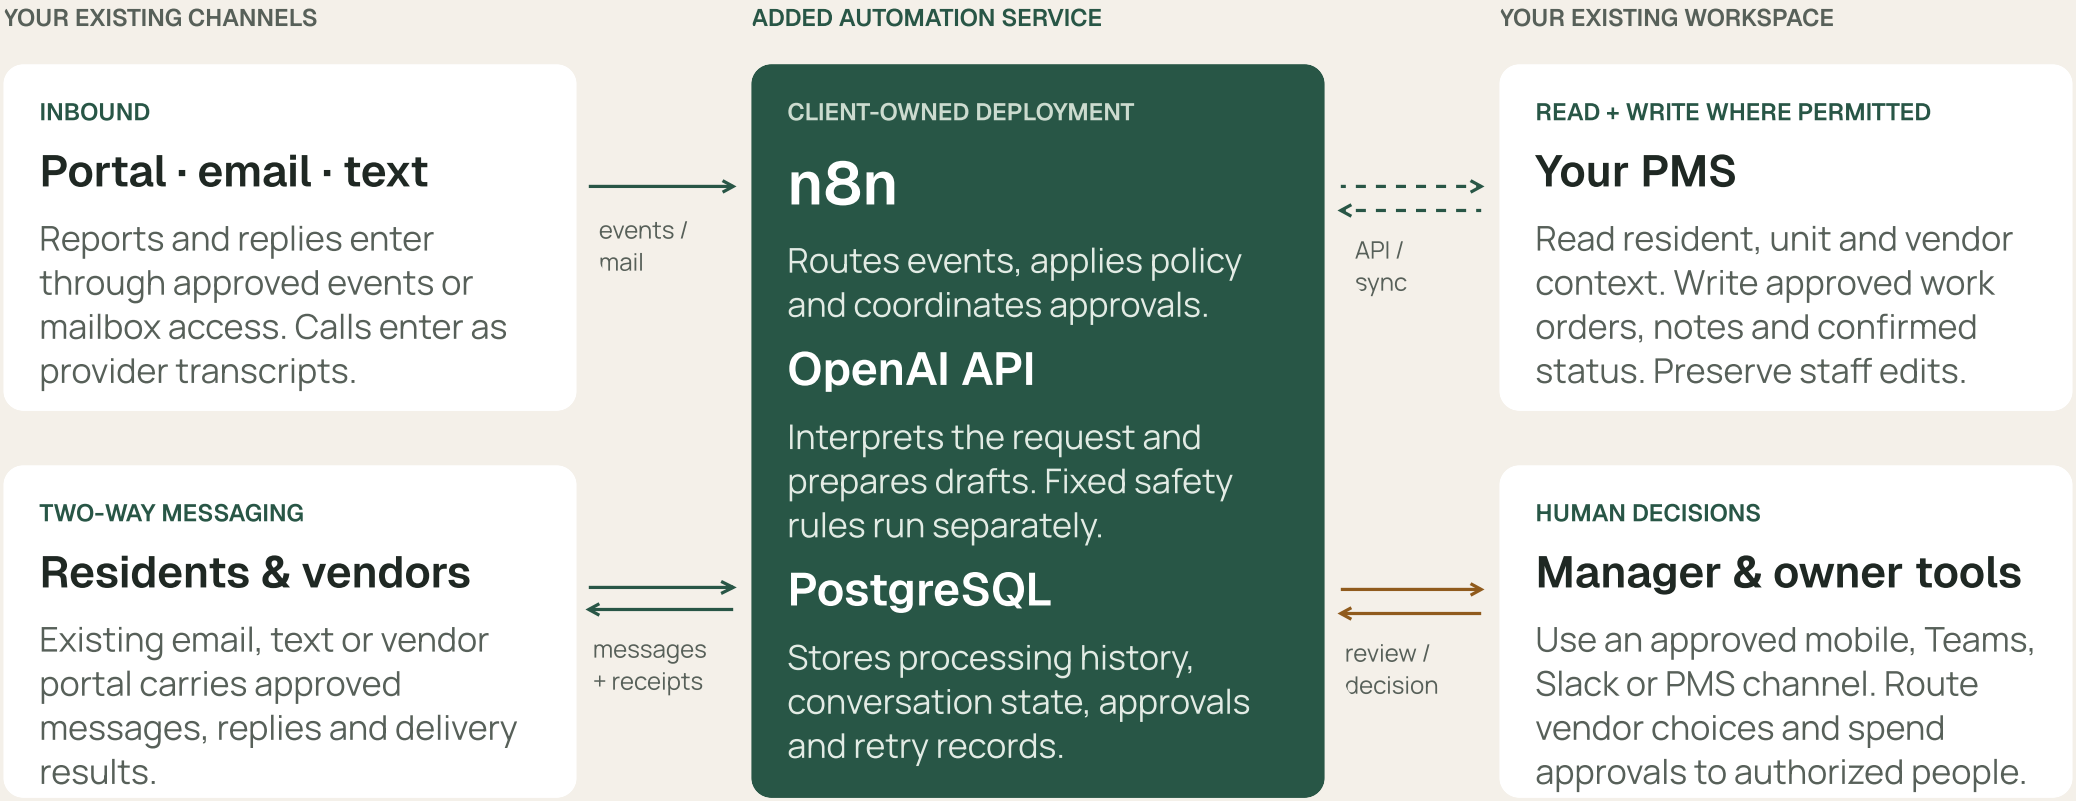

Record vendor responses and confirmed appointments. Staff verify completion and close in the PMS.

MONITOR UNTIL RESOLVED

Track owner, vendor and resident delays. Age flags overdue work; it never creates an emergency by itself.

How it connects to your business.

Your property management system (PMS) stays the business record. Connections depend on available access.

IF PMS WRITE ACCESS IS LIMITED

Start with a roster sync and prepared tasks or emails. Staff create the work order; add controlled write-back only after access is confirmed.

BEHIND THE SERVICE

Retries, monitoring, backups, access control and retention.

Solid: actions / Dashed: data sync

Start small. Expand on evidence.

A staged implementation keeps your current process available while the new workflow earns trust.

1 MAP & CONFIGURE

Confirm tools, permissions, resident identity, vendor coverage, spending limits and on-call rules.

2 RUN IN SHADOW

Read a copy of requests. Compare recommendations with staff decisions; send no resident or vendor messages.

3 ASSIST INTAKE

Enable approved receipt and clarification messages. Prepare records; staff retain control of material actions.

4 ENABLE APPROVALS

Pilot selected properties and trades. Test duplicate clicks, failed sends, owner approval and manual recovery.

5 EXPAND & HAND OVER

Expand after agreed gates pass. Train staff and document support. Disable forwarding or subscriptions to return to the existing process.

DEMO TODAY → CLIENT PRODUCTION

The demo shows email/form/Telegram triage, Airtable visibility and human-approved vendor email on synthetic data. PMS integration, verified identity and production controls require implementation. Broader safety testing remains a launch gate.

YOUR TEAM PROVIDES

A process owner, approved system access, tenant/vendor rosters, response rules and reviewers for pilot decisions.

IMPLEMENTATION DELIVERS

Configured connectors and workflows, safety tests, monitoring, recovery runbooks, staff training and handover.

AGREE THE LAUNCH GATES

Measure intake minutes, decision time, missed and unnecessary escalations, repeat contacts and exception age.

Pause expansion if safety or recovery checks fail.
