MAINTENANCE TRIAGE / BUSINESS CHANGE

What changes in your maintenance process

The same resident channels and PMS. Less manual preparation before your team decides.

RESEARCH REVIEWED

[Website / source]
[Portfolio / markets]
[Verified operating detail]

A NOTE FOR [DECISION MAKER]

Your [verified company detail] makes [operating goal] relevant. Connecting [intake] to [Client PMS] would help [team] spend less time gathering details and more time making informed decisions.

Assumed current process

Resident channels
Portal, email, SMS, or phone reports.

↓

Staff read and identify
Find the resident, unit, and open work.

↓

Staff chase missing details
Ask questions and piece replies together.

↓

Staff search and prepare
Look up policies, vendors, and job details.

↓

Staff decide and coordinate
Approve work, send it, and chase updates.

With the system

Same channels, connected
Reports enter one controlled intake.

↓

Identity and request linked
Match units, duplicates, and related work.

↓

Focused follow-up questions
Ask for missing details; keep replies linked.

↓

Context and options prepared
Check policy and vendors; draft job notes.

↓

Staff approve; actions tracked
Record confirmed sends and follow-ups.

STAYS	Channels, PMS, people's authority
REDUCED	Reading, copying, and chasing
ADDED	Connectors, workflow, AI, fixed rules, database, and follow-up checks

What this helps your team do

Repeat less preparation. Decide sooner.
Avoid duplicate actions. See who owns each step.

MAINTENANCE TRIAGE / END-TO-END WORKFLOW

From report to verified completion

One connected process, with questions, approvals, progress, and closure kept on the same record.

1. **Receive and connect**
   Keep the report and attachments; acknowledge receipt. Verify identity; link replies, duplicates, and incidents.
2. **Interpret and check**
   AI: urgency, trade, language, access, and pets.
   Fixed rules: apply policy; only raise urgency.
3. **Clarify and reassess**
   Ask approved questions for missing symptoms or details. Keep known facts; reassess replies and worsening issues.
4. **Prepare the work**
   Draft PMS notes and vendor instructions. Check trade, coverage, hours, and compliance.
5. **Obtain the human decision**
   Review the original, context, and rule reason. Hold, edit, reclassify, assign, choose a vendor, or seek owner approval.
6. **Execute the approved action**
   Claim once; update the PMS and contact the vendor. Tell the resident only what the send result confirms.
7. **Coordinate progress**
   Track acceptance, quotes, confirmed times, and delays. Answer status questions without opening new requests.
8. **Verify and close**
   Staff review completion evidence and close the PMS work order. Send the approved final update.

ROUTES THAT MATTER

Safety first

Alert the on-call role under policy. Do not wait for clarification.

Clarification loop

Reply received → reassess at step 2. No symptom yet? Ask before preparing vendor work.

Owner approval

Spend approval returns to step 5. Vendor contact waits for approval.

AT ANY STAGE

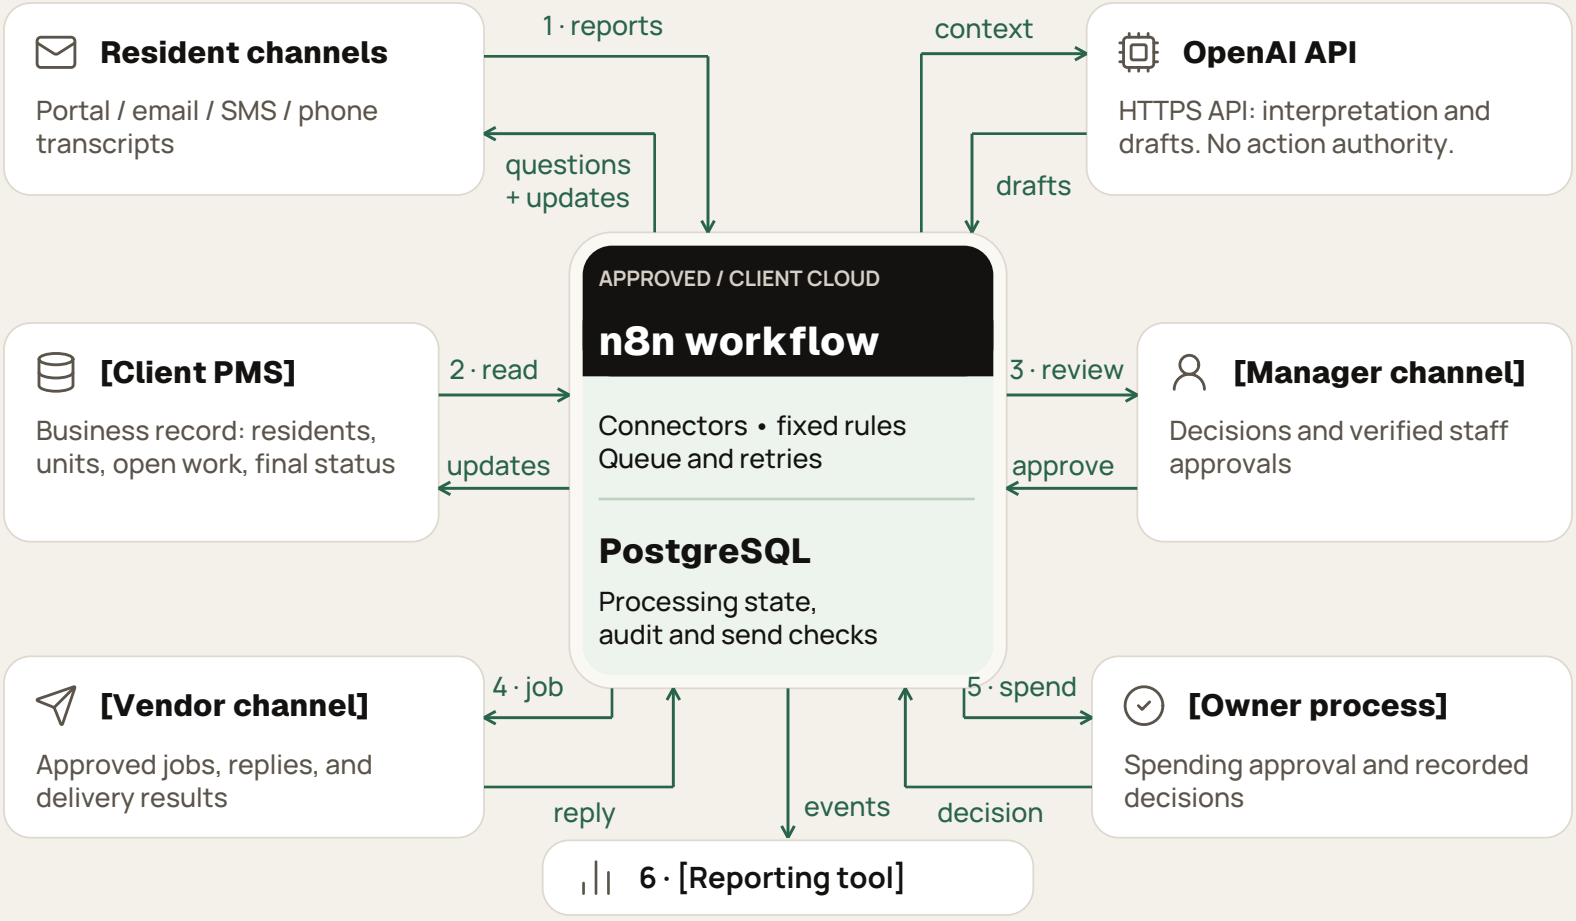
Human ownership

Unclear, sensitive, unreadable, or failed cases go to named staff. Use approved languages; identity and vendor gaps go to review.

MAINTENANCE TRIAGE / TOOLS & CONNECTIONS

How your systems connect

Proposed stack and routes. Access depends on the client's accounts and permissions.



CONNECTION METHODS / CONFIRM FOR EACH PROSPECT

1 [API / webhook / secure mailbox]
2 [API / partner / export-import route]
3 [App integration / secure review link]
4 [PMS vendor route / portal / email service]
5 [Existing owner approval process]
6 [Reporting connection]

Confirm: [Products], [permissions], [hosting / AI data policy]. If PMS writes are blocked, use [staff task / approved import]. Manager approvals must be authenticated; every route returns confirmed state where supported.

MAINTENANCE TRIAGE / OPERATIONS & OUTCOMES

How your team runs it each day

Staff work in familiar tools. Each waiting item or failed action has an owner and a next step.

Daily operating view

Priority work. Urgent and overdue items, owner/vendor delays, and unowned work.

Alerts. Follow on-call and quiet-hour rules; check unanswered emergencies. Age alone never creates an emergency.

Daily summary. Volume, response targets, waiting work, and exceptions.

Human authority

Staff control vendor selection, dispatch, spend, emergency downgrades, appointments, credits, and closure.

Sensitive-case review

Staff review legal and accommodation cases. Verify identity before revealing any records.

Controls and recovery

AI failure keeps reports and safety checks. Failed PMS updates or sends retry, then go to staff. Reject stale or duplicate approvals. Log decisions and send results; give residents confirmed facts.

Review data conflicts. Set roles, MFA, encryption, secrets, and retention. Monitor the full path; test backup restores, rule changes, and rollback. No self-training.

What this changes for the business

Linked history reduces chasing; policy-led alerts reduce interruptions. Confirmed updates and shared reporting support clearer handoffs and portfolio visibility.
