01 / What changes for your team

Maintenance requests, prepared.
Decisions stay with your team.

A production system that gathers details, prepares the next action, and tracks each handoff.

RESEARCH REVIEWED

[Company website]
[Portfolio / markets]
[Verified operating detail]

A NOTE FOR [DECISION MAKER]

Your [verified company detail] suggests a need to [specific operating goal]. I would connect [current intake] with [Client PMS] so [team] can review prepared requests instead of chasing the same details.

WHAT THE SYSTEM DOES

Capture and connect

Receive portal, email, SMS, and phone transcripts. Keep originals and attachments; verify identity; link repeats and group shared incidents.

Sort, protect, and clarify

Use approved languages; read urgency, trade, access, and pets. Apply fixed rules. Acknowledge receipt and ask only for missing details.

Prepare and coordinate

Draft PMS notes and vendor instructions; check vendor eligibility; route manager and owner approvals; send only authorized actions.

Track and keep people informed

Answer status questions without new tickets. Track vendor replies, appointments, progress, and closure; surface delays and failures.

What stays yours: PMS, resident channels, vendors, and decision authority.

02 / How a request moves

From the first message to an approved action.

Illustrative production example: spreading water under a kitchen sink at 10:42 p.m.

"Water is spreading under the kitchen sink. The tap is off but it is still flowing. My dog is here. You have permission to enter."

1 Match and preserve

Verify resident and unit; keep the original. Link replies; a vague opening gets a question, not a vendor task.

2 Interpret and check safety

AI suggests urgency and trade.

Fixed rules: raise urgency; never lower it.

3 Ask, then reassess

"When did it start spreading?" Keep replies together. Do not re-ask known access or pet details.

4 Route the right alert

Safety alerts do not wait. Routine work follows quiet-hour and task rules.

MANAGER RECEIVES

One prepared decision

Kitchen leak / [Unit]
Spreading water; flow continues.
Entry allowed; dog in unit.

Original, summary, rule reason, and vendor draft.

Vendors checked for trade, coverage, hours, and compliance.

Hold, edit, assign, select vendor, or seek owner approval.

After approval: send once and update the PMS. Hold sends nothing. Confirm vendor contact only after success. Status replies use recorded facts, not invented arrival times.

03 / What connects to what

Your existing tools.
A connected production service.

Proposed stack: n8n, PostgreSQL, and the OpenAI API. Exact routes follow your access and permissions.

Your portal, email, SMS, and phone-transcript service
[Intake route: API / webhook / secure mailbox] - confirm per channel.

↕

HOSTING: [CLIENT CLOUD / APPROVED HOST]

n8n + PostgreSQL

Workflows, fixed rules, queues, and retries.
Database: request state, audit, and send checks.
PMS retains business records and final status.

→ ←

OpenAI API

Approved context in;
summary and drafts out.
No action authority.

CONNECTION ROUTES / FILL FROM PROSPECT RESEARCH

[Client PMS]	↔	**[API / partner access / export route]** Read units and open work; write notes and status. If writes are blocked, return a staff task or approved import.
[Manager Channel]	↔	**[App API + approval callback / secure review link]** Send the decision; verify the user and return the approval. [Owner approval route] handles spending exceptions.
[Vendor Channel]	↔	**[PMS vendor API / vendor portal / email service]** Send approved work; capture replies and delivery results. Publish events to [Reporting Tool / connection route].

04 / Daily operation and control

The process continues after the vendor is contacted.

Production scope includes progress tracking, failure handling, and a named person for exceptions.

IN YOUR PMS / SAME WORK ORDER

Vendor replies → **Time confirmed** → **Work progresses** → **Staff verify**

Quote or acceptance | Then update resident | Chase stalled work | Then close the job

YOUR TEAM CONTROLS

Human decisions

Staff decide vendor, spend, owner approval, emergency downgrade, appointment, credits, and closure.

Review, not guesswork

Legal or accommodation cases, bad files, unclear identity/language, or no vendor: staff review.

Access and privacy

Agree hosting, AI data use, and retention. Encrypt data; protect secrets; use role-based access and MFA.

Changes and ownership

Test staff-approved rule changes; no self-training. Agree support, deletion, service targets, and rollback.

DAILY CHECKS AND RECOVERY

Follow up on stalled work

Recheck unanswered emergencies. Daily digests flag delays; age alone never makes an emergency.

Keep failed work visible

AI fails: keep the report for review. Send or PMS fails: retry, then assign staff. Do not claim success.

Prevent repeat or wrong actions

Reject duplicate or stale approvals. Flag PMS conflicts; never overwrite staff changes silently.

Check and recover the service

Monitor silent intake, test the full path, reconcile PMS data, and test encrypted backup restores.

Map this to your operation.
