Automation for property management

PREPARED FOR
[Decision Maker] / [Client Company]

MAINTENANCE REQUEST TRIAGE & COORDINATION

What changes in your process.

The same channels and PMS. Less preparation by hand, with your team still in control.

RESEARCH REVIEWED

A NOTE FOR [CLIENT COMPANY]

[A specific observation about your operation]

[Verified detail] suggests [coordination need]. Connecting [intake channel] to [Client PMS] would help [team] spend less time gathering details and more time deciding what happens next.

Assumed current process

Staff prepare each request

Resident channels receive the report
Portal, email, SMS or phone.

↓

Staff read and identify
Find the resident, unit and related work.

↓

Staff chase missing details
Ask questions and piece replies together.

↓

Staff search and prepare
Look up policies, vendors and history.

↓

Staff decide and coordinate
Approve, contact, record and follow up.

With the system

Preparation connected; people decide

The same resident channels stay
A connector brings each report into one flow.

↓

Identity and request linked
Verify context; link duplicates and replies.

↓

Focused follow-up questions
Ask what is missing; save and reassess replies.

↓

Context and options prepared
AI drafts; fixed rules check; eligible vendors listed.

↓

Staff approve; workflow tracks
Confirmed actions and follow-ups reach the PMS.

Stays
Channels, PMS, human authority

Reduced
Reading, copying, chasing

Added
Connected intake, AI, rules, state

What this helps

Less repeated preparation. Faster informed decisions.
Fewer duplicate actions and clearer ownership.

FROM REPORT TO COMPLETION

A complete process. Clear responsibility.

AI prepares information. The workflow follows policy. People authorize the work.

01 Receive and connect — WORKFLOW

Save reports and files; verify identity; link replies, duplicates and shared incidents. Acknowledge receipt.

02 Interpret and check — AI

Suggest urgency and trade; note language, access, pets and missing details.

> **Fixed rules, separate from AI**
> Only raise urgency. Safety alerts do not wait for clarification.

03 Clarify and reassess — AI + WORKFLOW

Ask approved follow-up questions. Keep known details; reassess each reply or worsening condition.

04 Prepare the work — AI + WORKFLOW

Draft PMS notes and vendor instructions. Check vendor trade, coverage, hours and compliance.

05 Obtain the human decision — MANAGER

Review the original report and reason. Hold, edit, reclassify, assign, select a vendor or seek owner approval.

06 Execute the approved action — WORKFLOW

Update the PMS and contact the vendor once. Tell the resident only after the send succeeds.

07 Coordinate progress — WORKFLOW + STAFF

Track acceptance, quotes, agreed appointments and delays. Answer status questions without a new request.

08 Verify and close — STAFF

Staff check completion evidence and close the work order. The workflow sends the approved final update.

Who handles what

AI interprets

Reads the report and drafts wording. It does not authorize action.

Workflow coordinates

Links records, applies rules, asks questions and carries out approved actions.

Your team decides

Approves vendors, spend and commitments; handles exceptions and closure.

Missing information

Clarification returns to assessment. A vague opening gets a symptom question, not a vendor task.

Owner approval

Returns to the approval gate before vendor contact.

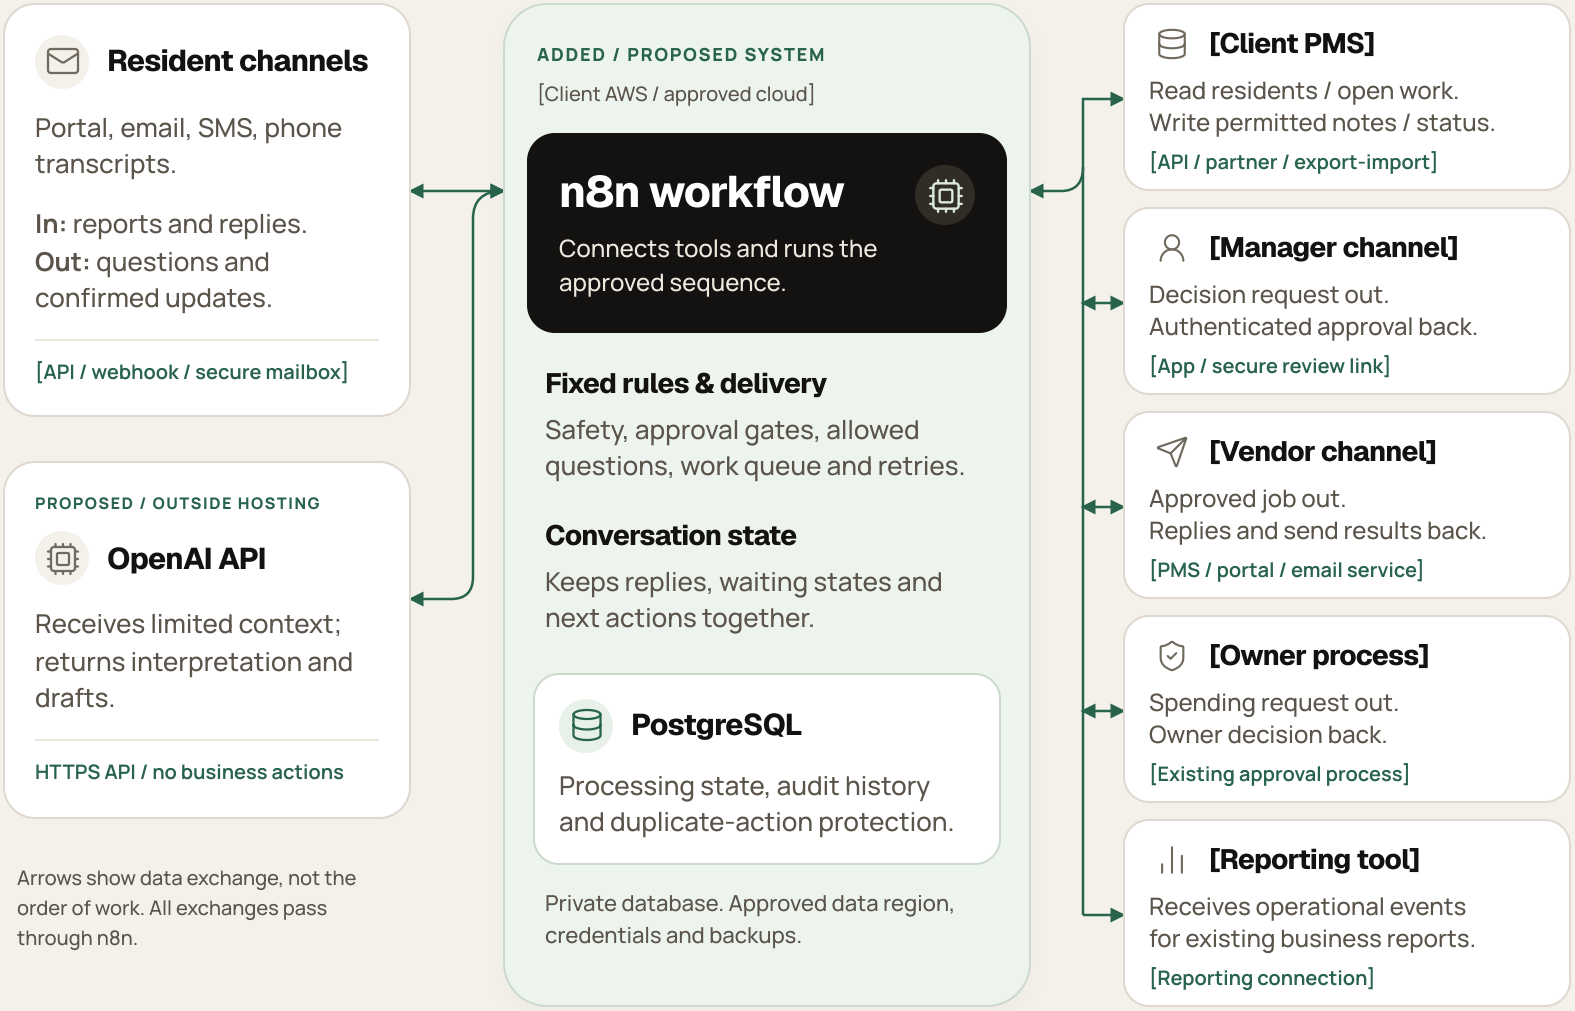

Human review at any stage

Unclear, sensitive, unsupported-language or failed cases get a named staff owner.

TOOLS, HOSTING & CONNECTIONS

Your tools, connected to one workflow.

Proposed production stack. Each route depends on your accounts, access and permissions.

Your PMS stays the business record

Final work orders and assignments stay there. PostgreSQL holds the workflow's processing history.

Confirm the route before connecting

[Products, permissions, hosting and AI data policy]. If writes are blocked: staff-approved tasks or imports.

Neutral: existing tools / green: added automation and data exchange

DAILY OPERATION & OVERSIGHT

Prepared work. Visible control.

Your team sees what needs attention, who owns it, and what happens next.

The daily operating view

Prioritize work. See overdue requests, owner approvals and vendor delays in one ordered list.

Alert by policy. Follow on-call and quiet-hour rules; check unanswered emergencies. Age alone never creates an emergency.

See the portfolio. Daily summaries and reports show waiting work, exceptions and ownership.

Your team keeps authority

Vendor choice and dispatch. Spending. Appointments and commitments. Emergency downgrades. Verified closure.

Sensitive cases stay with people

Legal, accommodation and liability issues go to trained staff. Unverified identity reveals no property information.

AI recommends. Authorized staff decide.

Controls that keep work visible

If a tool fails

Keep the request. Apply fixed rules when AI fails. Queue retries; assign failed or no-vendor cases to staff.

If records disagree

Reject stale or duplicate approvals. Flag PMS differences instead of overwriting staff changes.

Protect access and data

Role-based access, MFA, encrypted data, managed credentials and agreed retention.

Keep the service maintainable

Monitor intake and the full path. Test backup restores and approved changes; keep a rollback route. No self-training.

What this gives the business

Less chasing and interruption. Questions, reminders and policy-based alerts handle routine preparation.

More reliable handoffs. Named owners and confirmed facts make resident updates and portfolio reporting clearer.

Discuss your maintenance workflow.

Review your tools, connection routes and approval rules.
