Automation for property management

PREPARED FOR
[Decision Maker] / [Client Company]

MAINTENANCE REQUEST TRIAGE & COORDINATION

What changes in maintenance.

Same channels and PMS. Less preparation before your team decides.

RESEARCH REVIEWED

[Website / source]
[Portfolio / markets]
[Verified operating detail]

A NOTE FOR [DECISION MAKER]

At [Client Company], [verified detail] may make [operating goal] a priority. Connecting [intake] to [Client PMS] would put the details in one place for [team].

Assumed current process

- **Resident channels**
  Portal, email, SMS or phone.
- **Staff read and identify**
  Find the resident, unit and open work.
- **Staff chase missing details**
  Ask questions and piece replies together.
- **Staff search and prepare**
  Look up policies, vendors and job details.
- **Staff decide and coordinate**
  Approve work, send it and chase updates.

With the system

- **Same channels, connected**
  Reports enter a controlled intake.
- **Identity and request linked**
  Match units, duplicates and related work.
- **Focused follow-up questions**
  Ask what is missing; link replies.
- **Context and options prepared**
  Check policy and vendors; draft notes.
- **Staff decide; workflow tracks**
  Record confirmed sends and follow-ups.

Stays Channels, PMS, staff authority
Added Intake, AI, rules, request state, follow-up checks

Reduced Reading, copying, chasing

What this helps your team do

Less repeated prep and fewer duplicates.
Faster decisions with clear ownership.

FROM REPORT TO COMPLETION

From report to verified completion.

AI prepares. Workflow handles. Your team decides.

01 Receive and connect — WORKFLOW

Save the report; match resident and unit. Link replies, duplicates and incidents; acknowledge receipt.

02 Interpret and check — AI

Suggest urgency and trade; flag access, pets and language.

> **Fixed rules, separate from AI**
> Only raise urgency; safety alerts do not wait.

03 Clarify and reassess — AI + WORKFLOW

Ask approved follow-up questions. Link and reassess each reply.

04 Prepare the work — AI + WORKFLOW

Draft PMS and vendor notes; check trade, coverage, hours and compliance.

05 Obtain the human decision — MANAGER

Review the source and reason; hold, edit, change priority, assign, choose a vendor or seek owner approval.

06 Execute the approved action — WORKFLOW

After approval, update PMS and contact the vendor once. Update the resident only after a successful send.

07 Coordinate progress — WORKFLOW + STAFF

Track vendor replies, quotes, confirmed times and delays. Answer status without a new ticket.

08 Verify and close — STAFF

Staff verify and close in PMS; workflow sends the approved final update.

Who handles what

AI

Reads reports and drafts notes.

Workflow + rules

Links records, applies rules, asks questions and tracks sends.

Manager + staff

Managers approve; staff handle exceptions and close.

At any stage

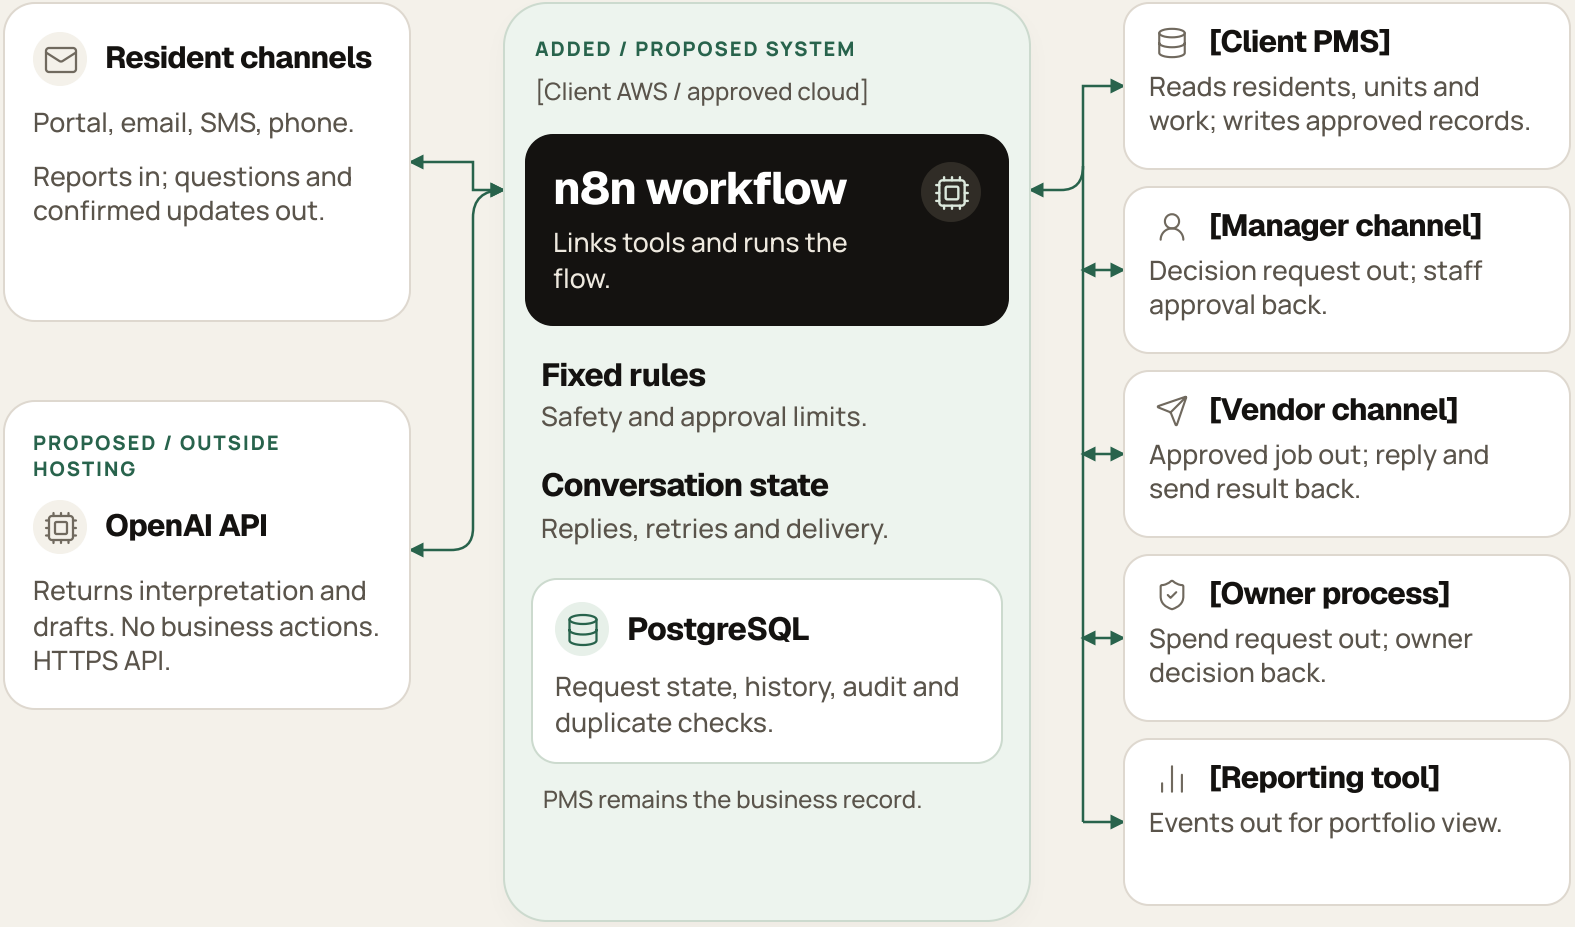

Unclear, sensitive or failed cases go to named staff.

Company policy sets automatic actions and approval limits

TOOLS & CONNECTIONS

How your systems connect.

Proposed stack and routes. Access depends on your accounts and permissions.

ROUTES TO CONFIRM WITH THE CLIENT

Intake: [API / webhook / secure mailbox]
Manager: [app / secure review link]
Owner: [existing approval]
PMS: [API / partner / import]
Vendor: [PMS / portal / email]
Reporting: [feed / export]

Neutral: existing tools / green: added automation and data exchange

OPERATIONS & OUTCOMES

How your team runs it each day.

Staff see what is waiting, who owns it and the next step.

Daily operating view

Priority work. Urgent and overdue items, delays and unowned work.

Alerts. Follow on-call and quiet-hour rules; check unanswered emergencies. Age alone never creates an emergency.

Daily summary. Volume, targets, waiting work and exceptions.

Human authority

Staff choose vendors and approve dispatch, spend, appointments, credits, emergency downgrades and closure.

Sensitive-case review

Legal or accommodation issues go to staff. Verify identity before sharing records.

Controls and recovery

Keep failures visible

Keep requests and safety checks if AI fails. Retry failed writes or sends; assign exceptions. Block stale or duplicate approvals.

Protect and maintain the service

Resolve data conflicts. Set roles/MFA, encryption, secrets and retention. Monitor; test backup restores and rollback. No self-training.

What this changes for the business

Linked history reduces chasing; policy-led alerts limit interruptions. Confirmed updates and reporting make handoffs easier to track.
